

FOUNDRY LOG — VERSION 1.0

Everything cast into TOHFA so far

A working record of what shipped in the first version of the storefront, the admin panel, and the systems running quietly underneath — from checkout security to the last coat of dark mode.

01 Storefront & Shopping

The customer-facing side of the site — browsing, discovery, and checkout.

-
- **Server-rendered catalog** Homepage and product pages render fresh on every visit, with pagination (5–100 per page), jump-to-page, and category & sort filters.
-
- **Search with autocomplete** Fuzzy suggestions as you type, so a slightly misspelled product name still finds its way home.
-
- **Product galleries** Multi-image flip/slide animation with hover and pinch zoom on the detail page.
-
- **Managed categories** Diyas, Idols, Corporate Gifts, Pocket Temples, Gifts, Pan Stands — plus whatever gets added later — power both the storefront filter and the product form.
-
- **Cart & coupon codes** Slide-out cart drawer with live coupon validation before the customer ever reaches payment.
-
- **Customer reviews** Star ratings on every product, shown only after an admin approves them.
-
- **Wishlist** Saved on-device, no account needed — heart icon on cards and a dedicated wishlist page.
-
- **Recently viewed** A quiet strip of what you looked at last, stored locally.
-
- **Share & copy link** Native share sheet or a one-tap copy link on every product.
-
- **Dark mode** Follows the system on first visit, remembers the choice after that, no flash of the wrong theme.
-
- **Promo banner** Public coupon codes surface on-site; private codes stay reserved for WhatsApp and social outreach.
-
- **Everyday polish** A branded 404 page, an installable PWA manifest, a cookie consent banner, and keyboard-focus styling throughout.
-

02 WhatsApp Communication

Order updates travel where customers actually read them.

-
- **Order alerts** Placed orders notify both the business number and the customer automatically via Green API.
-
- **Status updates** Changing an order's status in admin sends the customer a WhatsApp update — no separate email channel to check.
-
- **"Chat & ask for a discount"** A direct WhatsApp line on every product page, before the customer even adds to cart.
-
- **Printable invoice** The success page generates a GST-itemised invoice with your GSTIN, downloadable or printable on the spot.
-

03 Admin Panel

Password-gated, everything the business runs from day to day.

-
- **Products** Create and edit listings, multi-image galleries, and live inventory counts.
-
- **Categories** Add or remove the categories every product form and storefront filter draws from.
-
- **Orders** Full order list with status changes that trigger the WhatsApp update above.
-
- **Coupons** Flat or percentage discounts, usage caps, expiry dates, and a public/private visibility switch.
-
- **Review moderation** Nothing reaches the storefront until it's approved here.
-
- **Low-stock alerts** A heads-up before an item quietly runs out.
-

04 Payments & Tax

Live payments, priced and taxed correctly by default.

- **Razorpay checkout** Live keys, real transactions. `rzp_live`
- **GST invoicing** 5% GST is calculated back out of your GST-inclusive price and shown on the invoice — the customer never pays more than the sticker price.
- **Server-side pricing** Every price is recalculated from the database at payment time, regardless of what the browser sends.

05 Security & Data

The part customers never see, and the part that matters most.

- **Webhook signature verification** Every payment webhook is checked with an HMAC signature before an order is created. `HMAC-SHA256`
- **Authentic order notes** Order details are read back from Razorpay's own stored record, never trusted from the request that arrives.
- **Row Level Security** Orders, coupons, and categories are readable only by the server's service-role key — the public key the browser uses can't see them at all. `RLS`
- **Isolated service key** The one key that bypasses those restrictions never ships to the browser, by construction.
- **Gated admin routes** Every admin API sits behind the same password check as the admin panel itself.

06 Quality Assurance

Small, but it catches real regressions.

- **Automated test suite** 15 tests covering payment-signature verification, coupon math, and GST calculation, run before anything ships. `vitest`
